### **DETAILED ACTION**

Applicant's response was received and entered January 31, 2007.

- Claims 1-20 are pending.
- Claims 1, 2, 4, 13, 15 & 19 are amended.
- Claims 3 & 14 are canceled.
- Application is currently pending.

### Response to Amendment

Applicant's arguments and amendments with respect to claims 1-20 filed January 31, 2007 have been fully considered but they are not persuasive.

Applicant contends that the prior arts of record do not teach unloading each scan chain, identifying a last switching latch in each scan chain, repeating the generating loading and unloading steps, and checking the results by sending the identified last switching latch to a Physical Failure Analysis system. Examiner respectfully disagrees.

It is well known in the art that scan testing incorporates loading, unloading and comparison of data repeatedly. Further evidence of this identifying the last switching latch and a Physical Failure Analysis system can be seen in both the prior arts of records: "...applying enough scan clock cycles to load data into all of the latches...The SRL's are then unloaded using the shift register configuration again... If the actual data matches the predicted data, then the part passes the test." (Sarrica, column 2). "If a part fails one of the scan path tests, automated diagnostics attempts to locate the defect

and generate a repair call." (Sarrica, column 3). "The scan ring outputs are connected to TCM output pins such that the data is sent back out to the tester for evaluation." (Sarrica, column 3). "The address stepper SRL's supply the addresses for the arrays. All array locations must be written to when the arrays are being initialized." (Sarrica, column 5). "As an added benefit, it is also sometimes possible to detect latches with extraordinarily slow switching speed." (Sarrica, column 6). Evidence for identifying the last latch and localizing the defect is provided: "Diagnostic software can then count back through the channel data to determine which SRL is stuck, thereby finding the location." (Sarrica, column 8). "An example demonstrating the need for multiple patterns is given..." (Sarrica, column 9). It can be seen that Sarrica teaches loading and unloading data. It mentions that multiple patterns can be used. Further since each SRL has a corresponding address, which under testing condition is sent to Diagnostic Software. Hence, Sarrica teaches all of the above-mentioned limitations.

As admitted by the applicant Rajski clearly teaches generating deterministic patterns repeatedly and after applying the test patterns the signature is compared with an expected test pattern hence performing failure analysis. Finally, although the claims are interpreted in light of the specification, limitations from the specification are not read into the claims. See *In re Van Geuns*, 988 F.2d 1181, 26 USPQ2d 1057 (Fed. Cir. 1993).

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

Art Unit: 2138

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1-20 are rejected under 35 U.S.C. 103(a) as being unpatentable over Sarrica et al. (hereinafter Sarrica) enclosed NPL (Theory and Implementation of LSSD Scan Ring & STUMPS Channel Test and Diagnosis), and further in view of Rajski US Pat no. 6,662,327 B1.

As per claim 1:

Sarrica substantially teaches a method for implementing deterministic based broken scan chain diagnostics (Figure 5) using a computer test system connected to a Physical Failure Analysis system comprising the steps of: generating a deterministic test pattern (Figure 3 "PRPG"); loading the test pattern into each scan chain in a device under test using lateral insertion via system data ports and applying system clocks (page 198, Figure 6); unloading each scan chain and identifying a last switching latch in each scan chain (page 198, column 2); repeating the generating, loading, and unloading testing steps a selected number of times (page 199, column 1); and checking for consistent results of the identifies last switching latch in each scan chain (page 199,

Art Unit: 2138

column 1); and responsive to consistent results being identified, sending the identified last switching latch in each scan chain to said Physical Failure Analysis system to localize a physical defect (page 198, "Diagnostic software").

Sarrica does not explicitly teach the generation of the test pattern to be deterministic.

However, Rajski, in an analogous art, teaches a test generator that generates deterministic test patterns to test circuits under test, including scan chains (column 5, lines 45-66). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to allow Sarrica's invention to be able to test the can chain using deterministic, since one with ordinary skill in the art would have realized that enabling the invention to test with deterministic test patterns accounts for better fault coverage and enables the device to target random pattern-resistant faults. Further it should be noted that the combination of a pseudo random generator with an ATPG (generator of deterministic test patterns) was well-known in the art, at and before the time the invention was made, and was presented in the 'B. Chinaman in "LFSR-Coded Test Patterns for Scan Designs," Proceedings of European Test Conference, pp.237-242, 1991, this approach combines the benefit of pseudorandom and deterministic patterns' (column 3).

As per claim 2:

Sarrica/Rajski substantially teaches the method as rejected in claim 1 above, further including the steps responsive to consistent results not being identified, of

Art Unit: 2138

selecting another test pattern; and repeating the testing steps a selected number of times (page 199).

Sarrica does not explicitly teach the generation of the test pattern to be deterministic.

However, Rajski, in an analogous art, teaches a test generator that generates deterministic test patterns to test circuits under test, including scan chains (column 5, lines 45-66). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to allow Sarrica's invention to be able to test the can chain using deterministic, since one with ordinary skill in the art would have realized that enabling the invention to test with deterministic test patterns accounts for better fault coverage and enables the device to target random pattern-resistant faults. Further it should be noted that the combination of a pseudo random generator with an ATPG (generator of deterministic test patterns) was well-known in the art, at and before the time the invention was made, and was presented in the 'B. Chinaman in "LFSR-Coded Test Patterns for Scan Designs," Proceedings of European Test Conference, pp.237-242, 1991, this approach combines the benefit of pseudorandom and deterministic patterns' (column 3).

As per claim 4:

Sarrica/Rajski substantially teaches the method as rejected in claim 1 above.

Sarrica does not explicitly teach the generation of a test pattern wherein the step of generating a deterministic test pattern includes the steps of using perturbations of

one base deterministic test pattern from a base deterministic test pattern set generated by an Automatic Test Pattern Generation (ATPG) system.

However, Rajski, in an analogous art, teaches the generation of a test pattern wherein the step of generating a deterministic test pattern includes the steps of using perturbations of one base deterministic test pattern from a base deterministic test pattern set generated by an Automatic Test Pattern Generation (ATPG) system (Figure 4 # 74, column 7, lines 35-60). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to allow Sarrica's invention to be able to generate the deterministic test patterns using perturbations of a base deterministic test pattern, since one with ordinary skill in the art would have realized that enabling the invention to test with perturbations of the base deterministic test patterns would allow the invention to generate a variety of test patterns using minimal resources accounting for better fault coverage (column 7, lines 26-31). Further it should be noted that the combination of a pseudo random generator with an ATPG (generator of deterministic test patterns) was well-known in the art, at and before the time the invention was made, and was presented in the 'B. Chinaman in "LFSR-Coded Test Patterns for Scan Designs," Proceedings of European Test Conference, pp.237-242, 1991, this approach combines the benefit of pseudorandom and deterministic patterns' (column 3). Hence, the method of generating perturbations of base test patterns falls under the workable range of the invention and it has been held where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. In re Aller, 105 USPQ 233.

Art Unit: 2138

As per claim 5:

Sarrica/Rajski substantially teaches the method as rejected in claim 4 above.

Sarrica does not explicitly teach perturbations wherein the step of using perturbations of one base deterministic test pattern includes the steps of applying said one base deterministic test pattern from the base deterministic test pattern set to an exclusive OR and multiplexing a selected perturbation matrix entry using said exclusive OR.

However, Rajski, in an analogous art, teaches perturbations wherein the step of using perturbations of one base deterministic test pattern includes the steps of applying said one base deterministic test pattern from the base deterministic test pattern set to an exclusive OR and multiplexing (Figure 6 # 84) a selected perturbation matrix entry using said exclusive OR (Figure 4 # 78, column 7, lines 35-60). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to allow Sarrica's invention to create perturbations exclusive OR and multiplexing since one with ordinary skill in the art would have realized that enabling the invention to test with perturbations of the base deterministic test patterns would allow the invention to generate a variety of test patterns using minimal resources accounting for better fault coverage (column 7, lines 26-31). Further it should be noted that the combination of a pseudo random generator with an ATPG (generator of deterministic test patterns) was well-known in the art, at and before the time the invention was made, and was presented in the 'B. Chinaman in "LFSR-Coded Test Patterns for Scan Designs," Proceedings of European Test Conference, pp.237-242, 1991, this approach combines

Art Unit: 2138

the benefit of pseudorandom and deterministic patterns' (column 3). Hence, the method of generating perturbations of base test patterns falls under the workable range of the invention and it has been held where the general conditions of a claim are disclosed in

the prior art, discovering the optimum or workable ranges involves only routine skill in

the art. In re Aller, 105 USPQ 233.

As per claim 6:

Sarrica/Rajski substantially teaches the method as rejected in claim 5 above.

Sarrica does not explicitly teach perturbations, including the steps of providing a perturbation matrix with a plurality of perturbation matrix entries including selected ones of no invert, all invert, a predefined bit invert; rotate, and invert rotate.

However, Rajski, in an analogous art, teaches including the steps of providing a perturbation matrix with a plurality of perturbation matrix entries including selected ones of no invert, all invert, a predefined bit invert; rotate, and invert rotate (columns 7-8, lines 64-11). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to allow Sarrica's invention to create perturbations including selected inversions since one with ordinary skill in the art would have realized that enabling the invention to selectively invert would prevent the application of illegal states which could damage the circuit (column 7, lines 64-66). Further it should be noted that the combination of a pseudo random generator with an ATPG (generator of deterministic test patterns) was well-known in the art, at and before the time the invention was made, and was presented in the 'B. Chinaman in "LFSR-Coded Test Patterns for Scan Designs," Proceedings of European Test Conference, pp.237-242,

1991, this approach combines the benefit of pseudorandom and deterministic patterns' (column 3). Hence, the method of generating perturbations of base test patterns falls under the workable range of the invention and it has been held where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. *In re Aller*, 105 USPQ 233.

As per claim 7:

Sarrica/Rajski substantially teaches the method as rejected in claim 1 above, wherein the step of generating a test pattern includes the steps of using software Pseudo Random Pattern Generator (PRPG) (Figure 4, page 199).

Sarrica does not explicitly teach the generation of the test pattern to be deterministic.

However, Rajski, in an analogous art, teaches a test generator that generates deterministic test patterns to test circuits under test, including scan chains (column 5, lines 45-66). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to allow Sarrica's invention to be able to test the can chain using deterministic, since one with ordinary skill in the art would have realized that enabling the invention to test with deterministic test patterns accounts for better fault coverage and enables the device to target random pattern-resistant faults. Further it should be noted that the combination of a pseudo random generator with an ATPG (generator of deterministic test patterns) was well-known in the art, at and before the time the invention was made, and was presented in the 'B. Chinaman in "LFSR-Coded Test Patterns for Scan Designs," Proceedings of European Test Conference, pp.237-

242, 1991, this approach combines the benefit of pseudorandom and deterministic patterns' (column 3).

Page 11

As per claim 8:

Sarrica/Rajski substantially teaches the method as rejected in claim 1 above.

Sarrica does not explicitly teach the generation of the test pattern to be deterministic.

Sarrica does not explicitly teach the use of a set deterministic test pattern resident in memory.

However, Rajski, in an analogous art teaches the step of generating a deterministic test pattern including the steps of using a set of deterministic test patterns resident in a memory (Figure 4 # 70, column 7, lines 35-60). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to allow Sarrica's invention to be able to generate patterns from memory, since one with ordinary skill in the art would have realized that enabling the invention to use patterns resident in the memory would allow for an efficient use of resources. Further it should be noted that the combination of a pseudo random generator with an ATPG (generator of deterministic test patterns) was well-known in the art, at and before the time the invention was made, and was presented in the 'B. Chinaman in "LFSR-Coded Test Patterns for Scan Designs," Proceedings of European Test Conference, pp.237-242, 1991, this approach combines the benefit of pseudorandom and deterministic patterns' (column 3).

As per claim 9:

Sarrica/Rajski substantially teaches the method as rejected in claim 1 above, wherein the step of loading the test pattern into each scan chain in the device under test using lateral insertion via system data ports and applying system clocks includes the steps of applying values of the test pattern to selected one of scan chain inputs and primary inputs (Sarrica, page 198).

Sarrica does not explicitly teach the generation of the test pattern to be deterministic.

However, Rajski, in an analogous art, teaches a test generator that generates deterministic test patterns to test circuits under test, including scan chains (column 5, lines 45-66). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to allow Sarrica's invention to be able to test the can chain using deterministic, since one with ordinary skill in the art would have realized that enabling the invention to test with deterministic test patterns accounts for better fault coverage and enables the device to target random pattern-resistant faults. Further it should be noted that the combination of a pseudo random generator with an ATPG (generator of deterministic test patterns) was well-known in the art, at and before the time the invention was made, and was presented in the 'B. Chinaman in "LFSR-Coded Test Patterns for Scan Designs," Proceedings of European Test Conference, pp.237-242, 1991, this approach combines the benefit of pseudorandom and deterministic patterns' (column 3).

As per claim 10:

Sarrica/Rajski substantially teaches the method as rejected in claim 1 above, wherein the step of loading the deterministic test pattern into each scan chain in the device under test using lateral insertion via system data ports and applying system clocks includes the steps of applying values of the test pattern to selected one of scan chain inputs and primary inputs of latches within each scan chain (Sarrica, page 198).

Sarrica does not explicitly teach the generation of a test pattern wherein the step of generating a deterministic test pattern includes the steps of using perturbations of one base deterministic test pattern from a base deterministic test pattern set generated by an Automatic Test Pattern Generation (ATPG) system.

However, Rajski, in an analogous art, teaches the generation of a test pattern wherein the step of generating a deterministic test pattern includes the steps of using perturbations of one base deterministic test pattern from a base deterministic test pattern set generated by an Automatic Test Pattern Generation (ATPG) system (Figure 4 # 74, column 7, lines 35-60). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to allow Sarrica's invention to be able to generate the deterministic test patterns using perturbations of a base deterministic test pattern, since one with ordinary skill in the art would have realized that enabling the invention to test with perturbations of the base deterministic test patterns would allow the invention to generate a variety of test patterns using minimal resources accounting for better fault coverage (column 7, lines 26-31). Further it should be noted that the combination of a pseudo random generator with an ATPG (generator of deterministic test patterns) was well-known in the art, at and before the time the invention was made,

Art Unit: 2138

"Oondon 14dinber: 10/021, 10

and was presented in the 'B. Chinaman in "LFSR-Coded Test Patterns for Scan Designs," Proceedings of European Test Conference, pp.237-242, 1991, this approach combines the benefit of pseudorandom and deterministic patterns' (column 3). Hence, the method of generating perturbations of base test patterns falls under the workable range of the invention and it has been held where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. *In re Aller*, 105 USPQ 233.

As per claim 11:

Sarrica/Rajski substantially teaches the method as rejected in claim 1 above, wherein the step of loading the test pattern into each scan chain in the device under test using lateral insertion via system data ports and applying system clocks includes the steps of applying random data from a software Pseudo Random Pattern Generator (PRPG) to scan chain inputs and primary inputs (Figure 4, page 199).

Sarrica does not explicitly teach the generation of the test pattern to be deterministic.

However, Rajski, in an analogous art, teaches a test generator that generates deterministic test patterns to test circuits under test, including scan chains (column 5, lines 45-66). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to allow Sarrica's invention to be able to test the can chain using deterministic, since one with ordinary skill in the art would have realized that enabling the invention to test with deterministic test patterns accounts for better fault coverage and enables the device to target random pattern-resistant faults. Further it

Page 15

should be noted that the combination of a pseudo random generator with an ATPG (generator of deterministic test patterns) was well-known in the art, at and before the time the invention was made, and was presented in the 'B. Chinaman in "LFSR-Coded Test Patterns for Scan Designs," Proceedings of European Test Conference, pp.237-242, 1991, this approach combines the benefit of pseudorandom and deterministic patterns' (column 3).

As per claim 12:

Sarrica/Rajski substantially teaches the method as rejected in claim 1 above wherein the step of loading the deterministic test pattern into each scan chain in the device under test using lateral insertion via system data ports and applying system clocks (Sarrica, page 198).

Sarrica does not explicitly teach perturbations wherein the step of using perturbations of one base deterministic test pattern includes the steps of applying said one base deterministic test pattern from the base deterministic test pattern set to an exclusive OR and multiplexing a selected perturbation matrix entry using said exclusive OR.

However, Rajski, in an analogous art, teaches perturbations wherein the step of using perturbations of one base deterministic test pattern includes the steps of applying said one base deterministic test pattern from the base deterministic test pattern set to an exclusive OR and multiplexing (Figure 6 # 84) a selected perturbation matrix entry using said exclusive OR (Figure 4 # 78, column 7, lines 35-60). Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to

allow Sarrica's invention to create perturbations exclusive OR and multiplexing since one with ordinary skill in the art would have realized that enabling the invention to test with perturbations of the base deterministic test patterns would allow the invention to generate a variety of test patterns using minimal resources accounting for better fault coverage (column 7, lines 26-31). Further it should be noted that the combination of a pseudo random generator with an ATPG (generator of deterministic test patterns) was well-known in the art, at and before the time the invention was made, and was presented in the 'B. Chinaman in "LFSR-Coded Test Patterns for Scan Designs," Proceedings of European Test Conference, pp.237-242, 1991, this approach combines the benefit of pseudorandom and deterministic patterns' (column 3). Hence, the method of generating perturbations of base test patterns falls under the workable range of the invention and it has been held where the general conditions of a claim are disclosed in the prior art, discovering the optimum or workable ranges involves only routine skill in the art. *In re Aller*, 105 USPQ 233.

As per claims 13 & 15-18:

Claims 13 & 15-18 are directed to an apparatus of the method for implementing deterministic testing of Claims 1-12. Sarrica, and Rajski teach, either alone or in combination as stated above, the method for implementing deterministic testing as set forth in Claims 1-12. Therefore, Sarrica and Rajski also teach, either alone or in combination as stated above, an apparatus as set forth in Claims 13 & 15-18.

As per claims 19-20:

Art Unit: 2138

Claims 19-20 are directed to a computer program of the method for implementing deterministic testing of Claims 1-12. Sarrica, and Rajski teach, either alone or in combination as stated above, the method for implementing deterministic testing as set forth in Claims 1-12. Therefore, Sarrica and Rajski also teach, either alone or in combination as stated above, a computer program as set forth in Claims 19-20.

#### Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Saqib J. Siddiqui whose telephone number is (571) 272-6553. The examiner can normally be reached on 8:00 to 4:30.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Albert Decady can be reached on (571) 272-3819. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Examiner's Note: Examiner has cited particular columns and line numbers in the references as applied to the claims above for the convenience of the applicant.

Although the specified citations are representative of the teachings in the art and are applied to the specific limitations within the individual claim, other passages and figures may apply as well. It is respectfully requested from the applicant, in preparing the responses, to fully consider the references in entirety as potentially teaching all or part of the claimed invention, as well as the context of the passage as taught by the prior art or disclosed by the examiner
